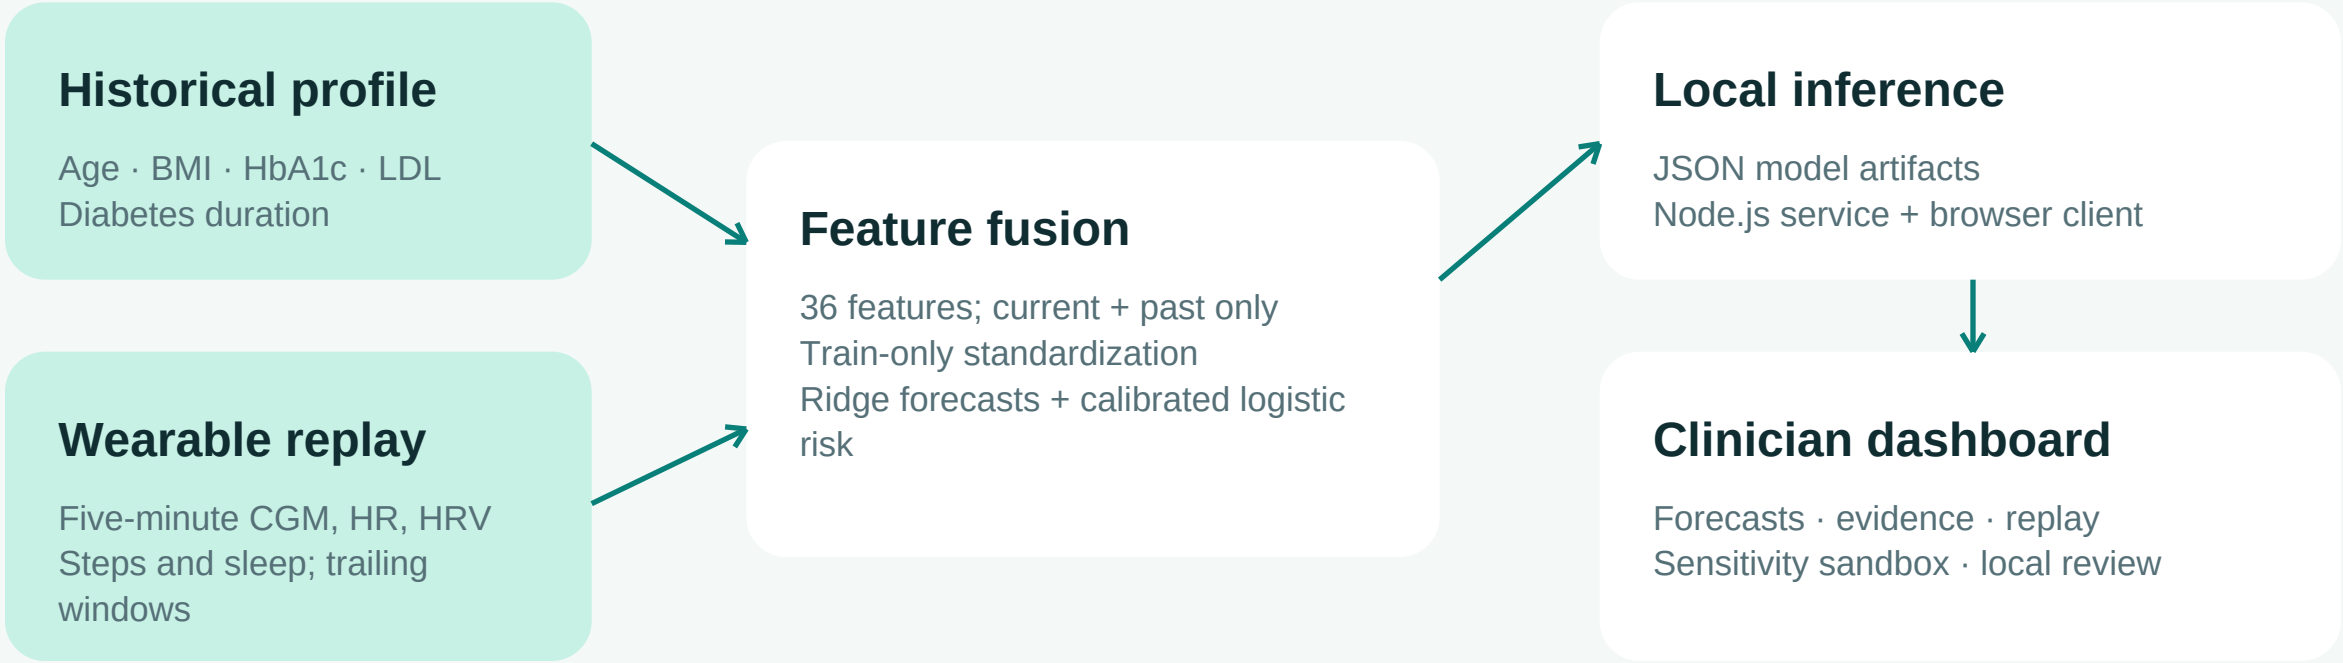
Two streams. One inspectable patient state.

Implemented local prototype: synthetic data generation, trained models and clinician review.



Future observations are training labels only. They never enter the inference feature window.

A separate training path protects the test cohort.

Patient-level partitions keep one person’s repeated windows together.

144

Training patients

Fit scaling, Ridge and logistic models.
20,160 windows.

48

Validation patients

Fit probability calibration and residual intervals.
6,720 windows.

48

Test patients

Report final metrics and ablations.
6,720 windows.

BOUNDARY

Generated data only · no real device or EHR connection · no treatment recommendation
Local demo state is not a clinical record. Clinical validation and governed deployment are future work.
